

REVOLUTIONARY ECG SOLUTIONS

LifeSync Corporation is a medical device company dedicated to the continued development, marketing and sale of the LifeSync® Wireless System. The LifeSync® System is the first wireless electrocardiogram (ECG) data communication system appropriate for use in hospital and outpatient settings where cardiac ECG and respiration monitoring are required. LifeSync's products and systems are FDA approved and sold to hospitals and stress labs across the United States. The Company believes the LifeSync® System, when used in conjunction with existing patient monitoring devices, is the new standard for ECG monitoring.

We've got it.

Presenting the LifeSync® Wireless ECG System and LeadWear® Disposable.

Welcome to a new era in emergency care.

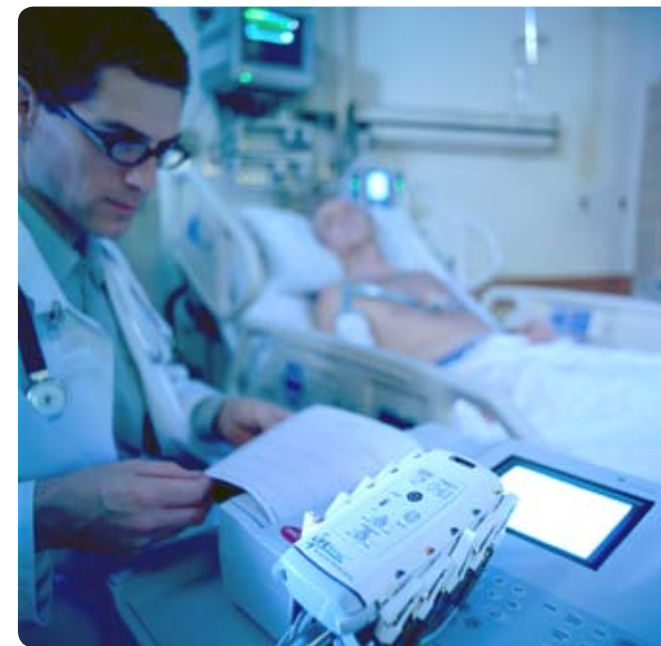

Efficiency

In an emergency room, door to balloon time is crucial to patient care. The award-winning design of the single-patient-use LifeSync® LeadWear® Disposable eliminates disconnecting and reconnecting leads before and after transport saving valuable staff time and improving patient outcomes.¹ "One-click" is all that is needed to transfer the patient from one monitor to another.

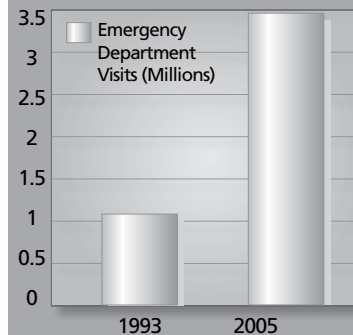

Flexibility

The LifeSync® ECG System is compatible with most types of monitoring equipment throughout the hospital providing quick connect/disconnect through the use of either wireless transceivers or an adapter. With that kind of adaptability, the LifeSync® ECG System can be configured to fit the needs of virtually every emergency department.

Capability

The LifeSync® LeadWear® Disposable is radiolucent allowing clear visualization of the patient's torso on x-rays and can be used for 3-lead, 5-lead, and 12-lead applications. Standard 12-lead placement provides consistent data for accurate ECG comparison and diagnosis.² Helping you make the right decision – faster.

According to the National Hospital Ambulatory Medical Care Survey data for 1993–2005, visits to the emergency departments for skin infections almost tripled from 1.2 million in 1993 to 3.4 million in 2005. This increase in visits requires additional attention and resources in order to deliver timely accurate care to patients. The LifeSync® LeadWear® Disposable can help reduce the risk of hospital acquired infections by eliminating existing potential pathways for contamination.³

Infection control

The ED is the entry-point to the patient pathway throughout the hospital. Therefore, preventing cross-contamination in the ED can have significant benefits throughout the pathway.¹ When used as part of a comprehensive infection-prevention program, the LifeSync® ECG System can help reduce the risk of hospital acquired infections by eliminating one of the last reusable items in patient care: ECG lead wires.

The LifeSync® System is the first wireless electrocardiogram (ECG) data communication system appropriate for use in hospital settings where ECG and respiration monitoring are required.²

"Your system allowed our patients to be cared for without the frustration of ECG wires and the associated nosocomial infectants that lingered on them. Time previously spent cleaning ECG wires has been reallocated to patient care. I highly recommend the LifeSync® System as the gold standard."
